Preface:

This report presents the results of a study on marketing value chain of some agricultural crops in the Kurdistan region of Iraq, and production – marketing value chain of the greenhouses projects in Syrian refugees camps, which are built by (UNHCR) organization in three different governorates (Sulaimanyah, Erbil, and Dohuk). To illustrate all the main characters and links that control the processes within the value chain in all its aspects, the search for the weaknesses, strengths, opportunities and threats of the project were academically analyzed. This study was also funded by (UNDP, ACF) as a part of study feasibility. In addition, As part of the research framework, several ways were conducted to look for the crisis of Syrian refugees and find out possible responses along with providing the humanitarian assistance and creating a state of self-reliance in the long-term stay. With the expectation of continuing conflicts in Syria in the foreseeable future, the existence of the financial crisis in Kurdistan region, and the decline in international humanitarian aid, this study was successfully investigated and proposed scientific outcomes and future recommendations for the relevant authorities.
